Bologna
Sabato 1 Giugno 2019

«Validazione di metodi colturali per la ricerca di batteri anaerobi e sporigeni in terreni di coltura, conservazione e trasporto di tessuti oculari»

Piera Santoro
Banca degli occhi di Torino

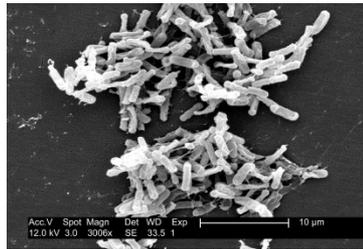

We have to validate a standardized protocol that allows the detection of microorganisms as fast as possible before transplantation

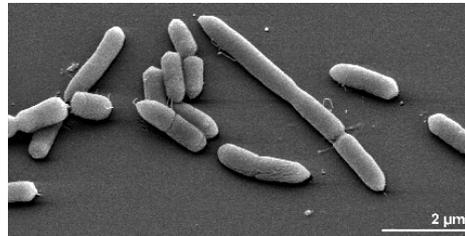

Batteri anaerobi nelle infezioni cliniche

- Anaerobic bacteria were detected in 30% of children with conjunctivitis

-clostridi spp

-bacilli anaerobi gram negativi

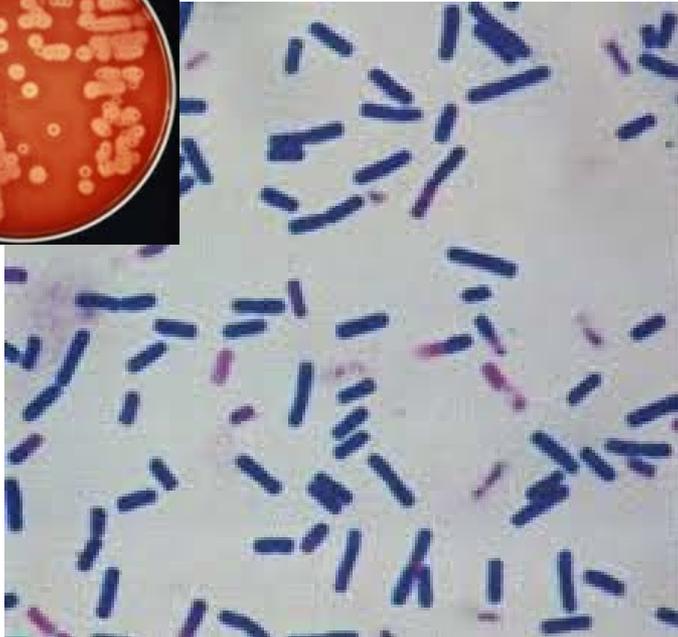

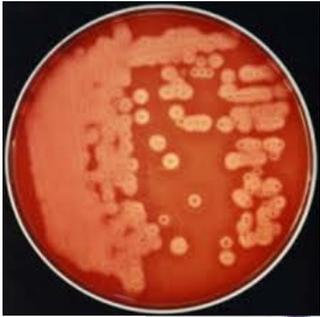

-peptostreptococcus

- Anaerobic bacteria are frequently detected in contact lens wearers

Clostridi and *Bacilli*: anaerobi sporigeni, le cui spore determinano elevata resistenza a variazioni termiche e disinfettanti

Clostridium spp

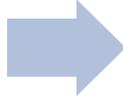

Bacillus spp

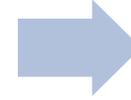

CONGIUNTIVITI

- *Staphylococcus aureus*
- *Streptococcus pneumoniae*
- *Haemophilus influenzae*
- *Neisseria gonorrhoeae*
- *Haemophilus parainfluenzae*
- Group b *Streptococcus*
- *Enterobacteriaceae* (*Klebsiella pneumoniae* and *Proteus mirabilis*)
- *Pseudomonas aeruginosa*

CHERATITI

- *Staphylococci*
- *Streptococci*
- *Pseudomonas*
- *Enterobacteriaceae*
- *Corynebacterium*
- *Acantameba moraxella*
- *Serratia*
- *Neisseria gonorrhoea*
- *Acantameba*
- *Aspergillus*
- *Candida*
- *Fusarium*
- *Propionibacterium*

ENDOFTALMITI

- *Coagulase negative Staphylococcus*
- *Staphylococcus aureus*
- *Streptococci*
- *Propionibacterium acnes*
- *Yeasts and molds*
- POSTOPERATIVE ACUTE ENDOPHTHALMITIS
- *Enterobacteriaceae*
- *Pseudomonas aeruginosa*
- *Propionibacterium Acnes*
- CHRONIC ENDOPHTHALMITIS
- *Mycobacterium spp*
- POST-TRAUMATIC ENDOPHTHALMITIS
- *Bacillus cereus*
- *Funghi*
- *Streptococci*
- *Clostridium spp*
- *Microsporidia spp*
- ENDOGENOUS ENDOPHTHALMITIS

Congiuntivite

Cheratite

Endoftalmite

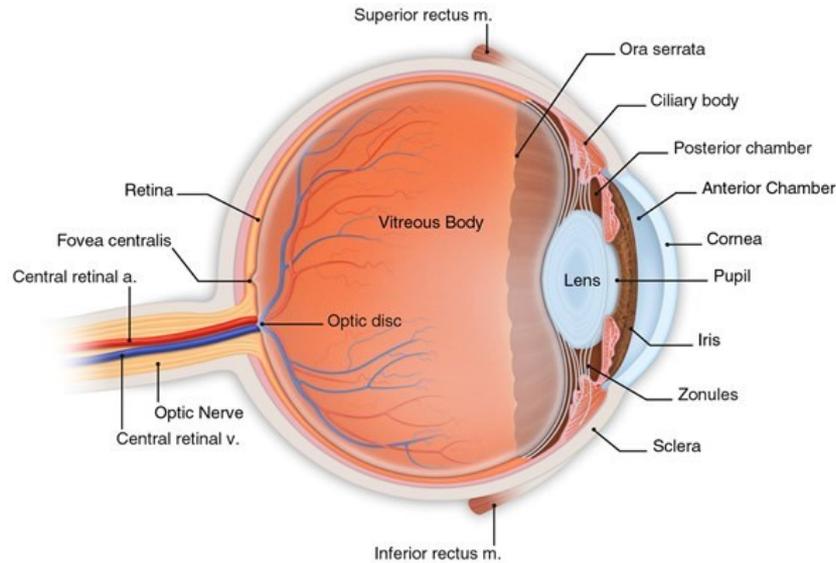

Dacrioadenite

Dacriocistite

Canalicolite

Cellulite presettale e orbitaria

COMPARTIMENTO INTERNO

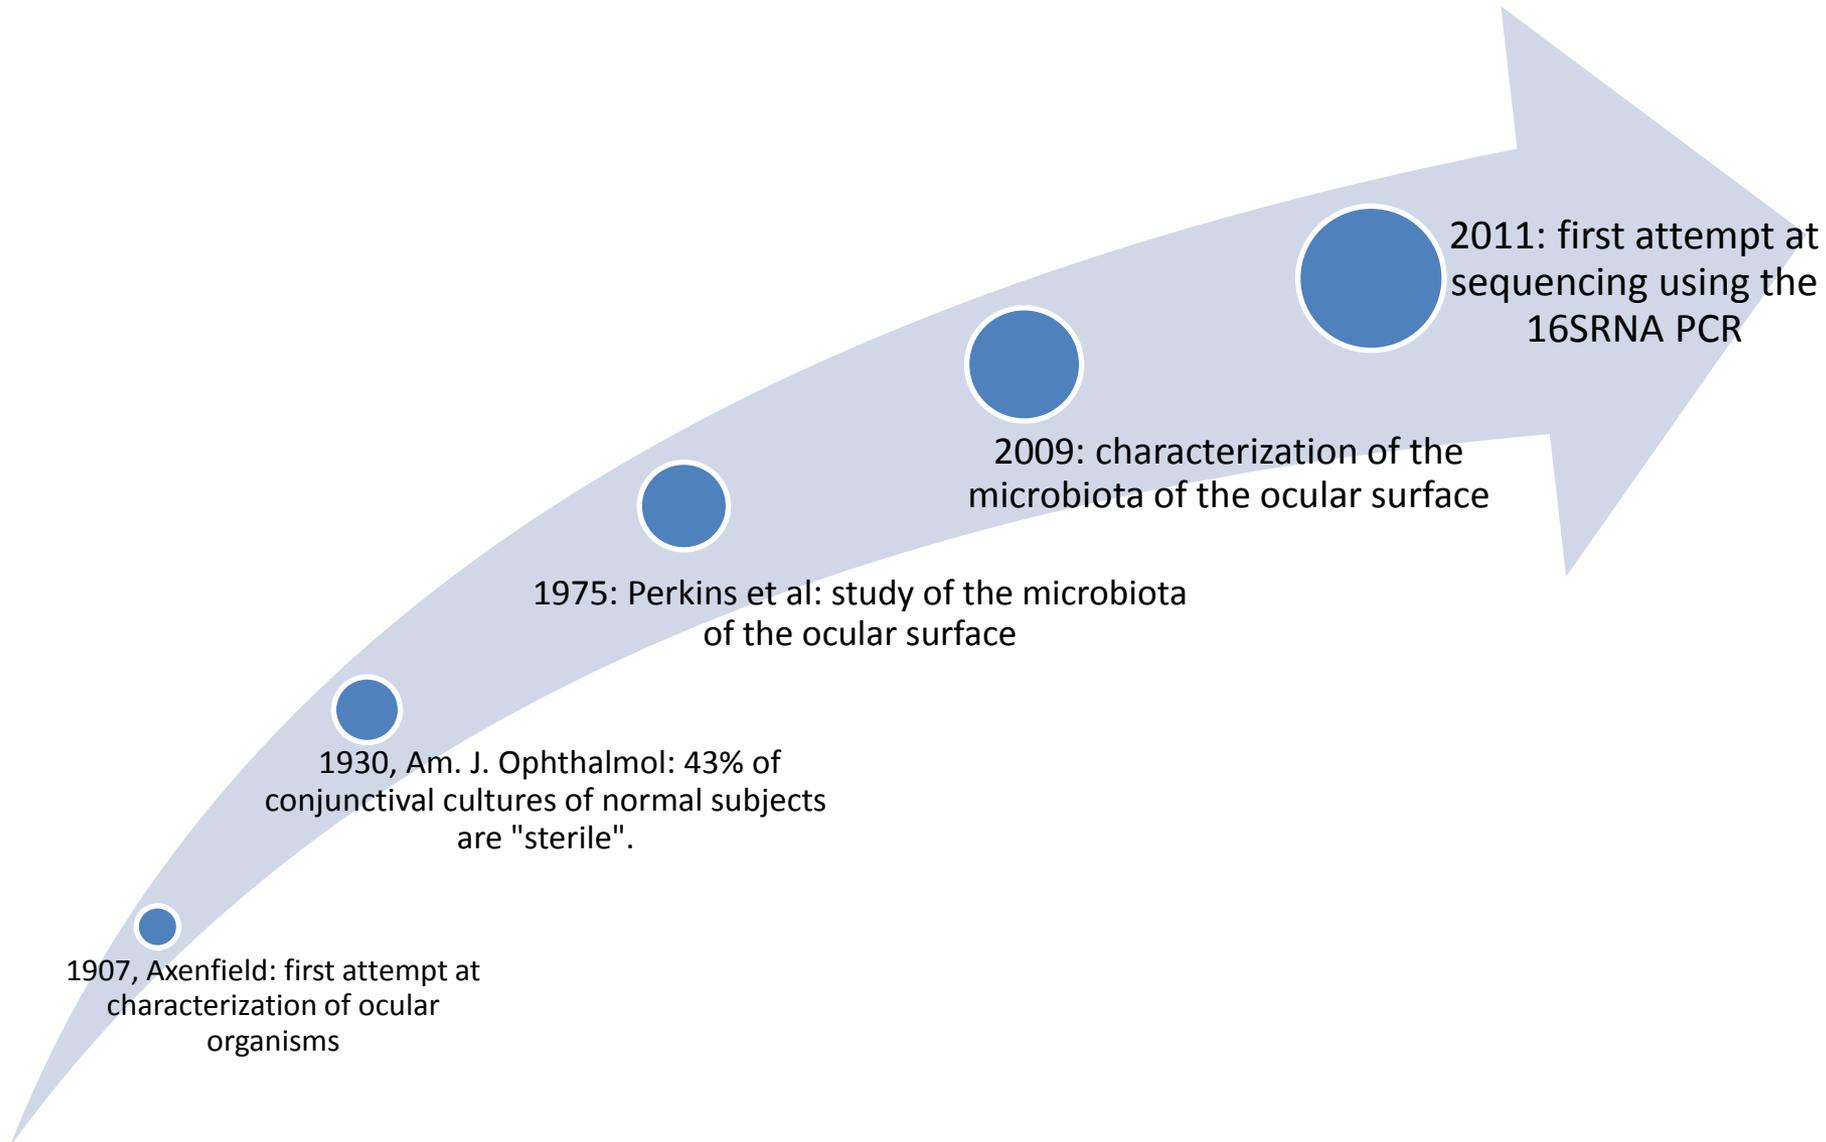

(sterile environment, physically separated from the immune system by the blood retinal barrier):

Anterior and posterior chambers, iris, lens, vitreous cavity, retina, ciliar body, choiroid, intrinsic ocular muscles

COMPARTIMENTO ESTERNO

(exposed to microorganisms in the environment):

Conjunctiva, cornea, sclera, tear film

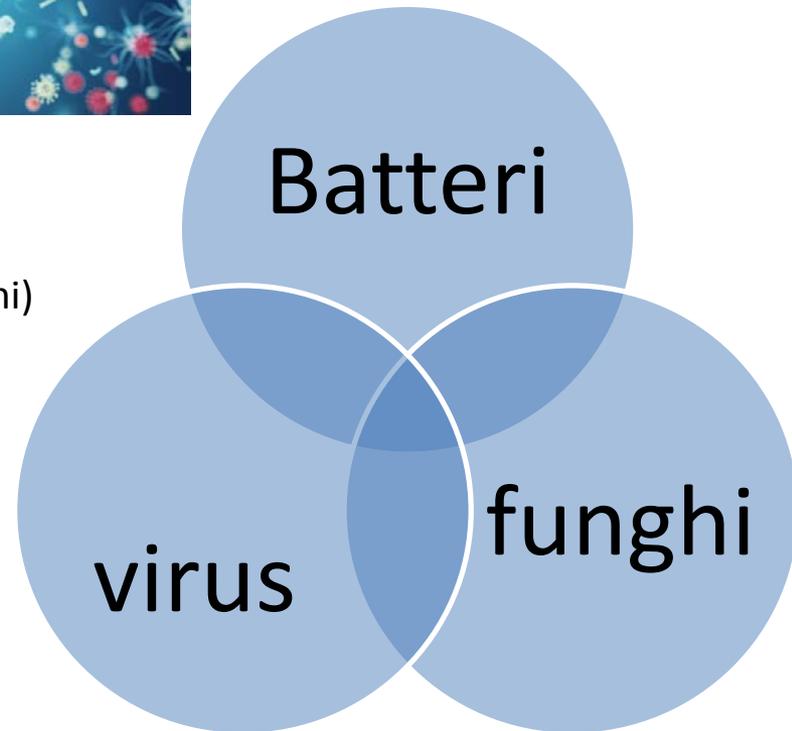

Microbioma:

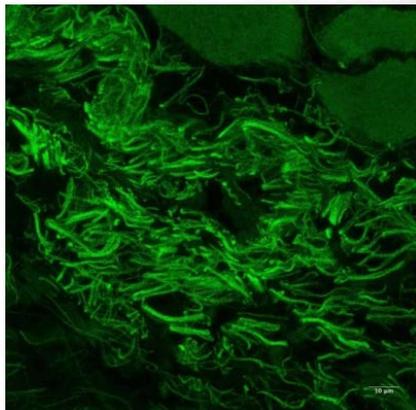

Batteri

Virus (herpes simplex nel 30% di individui sani)

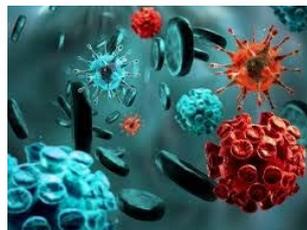

Funghi (30% di bambini)

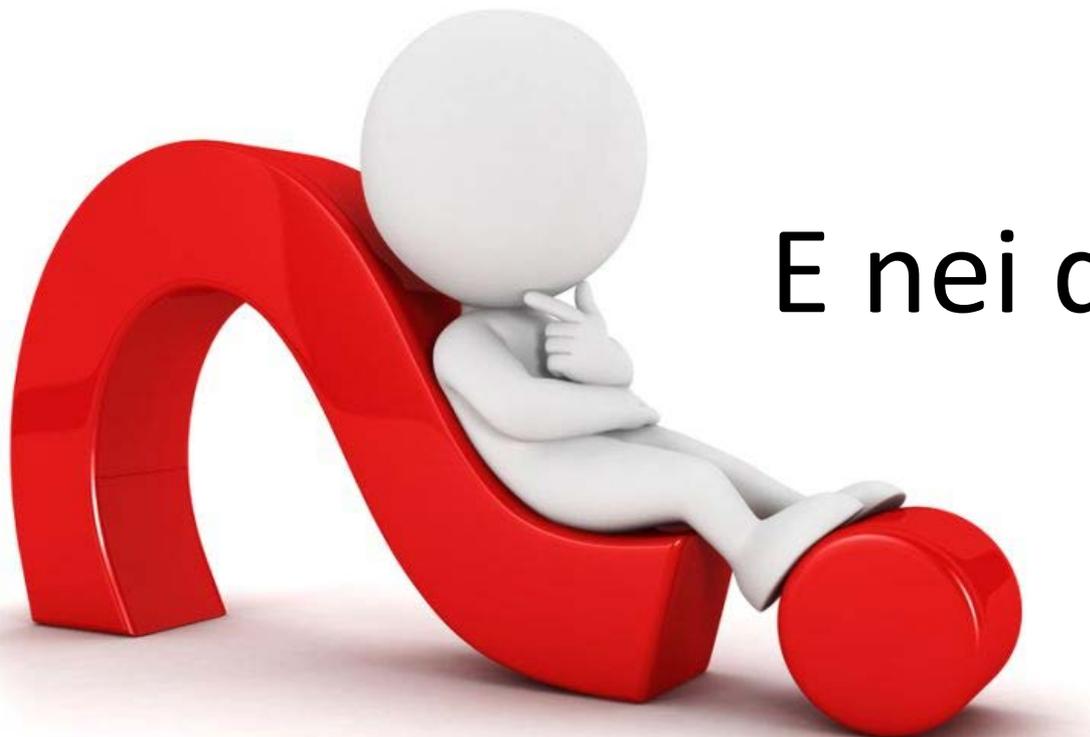

Il MICROBIOMA, con le cellule epiteliali della superficie oculare, assume un ruolo protettivo nella prevenzione della colonizzazione dei patogeni

Il MICROBIOMA della superficie oculare può essere alterato da fattori umani e ambientali, da condizioni patologiche, da antibiotici, da eventuali infezioni e dalla presenza di lenti a contatto

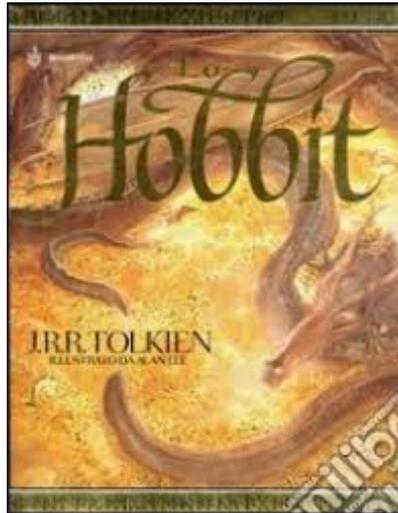

E nei donatori?

Se volete trovare qualcosa, non c'è niente di meglio che cercare

(J.R.R. TOLKIEN – Lo Hobbit)

Quello che si trova dipende da ciò che si sta cercando

Contaminating Bacteria Eye Bank Of Turin

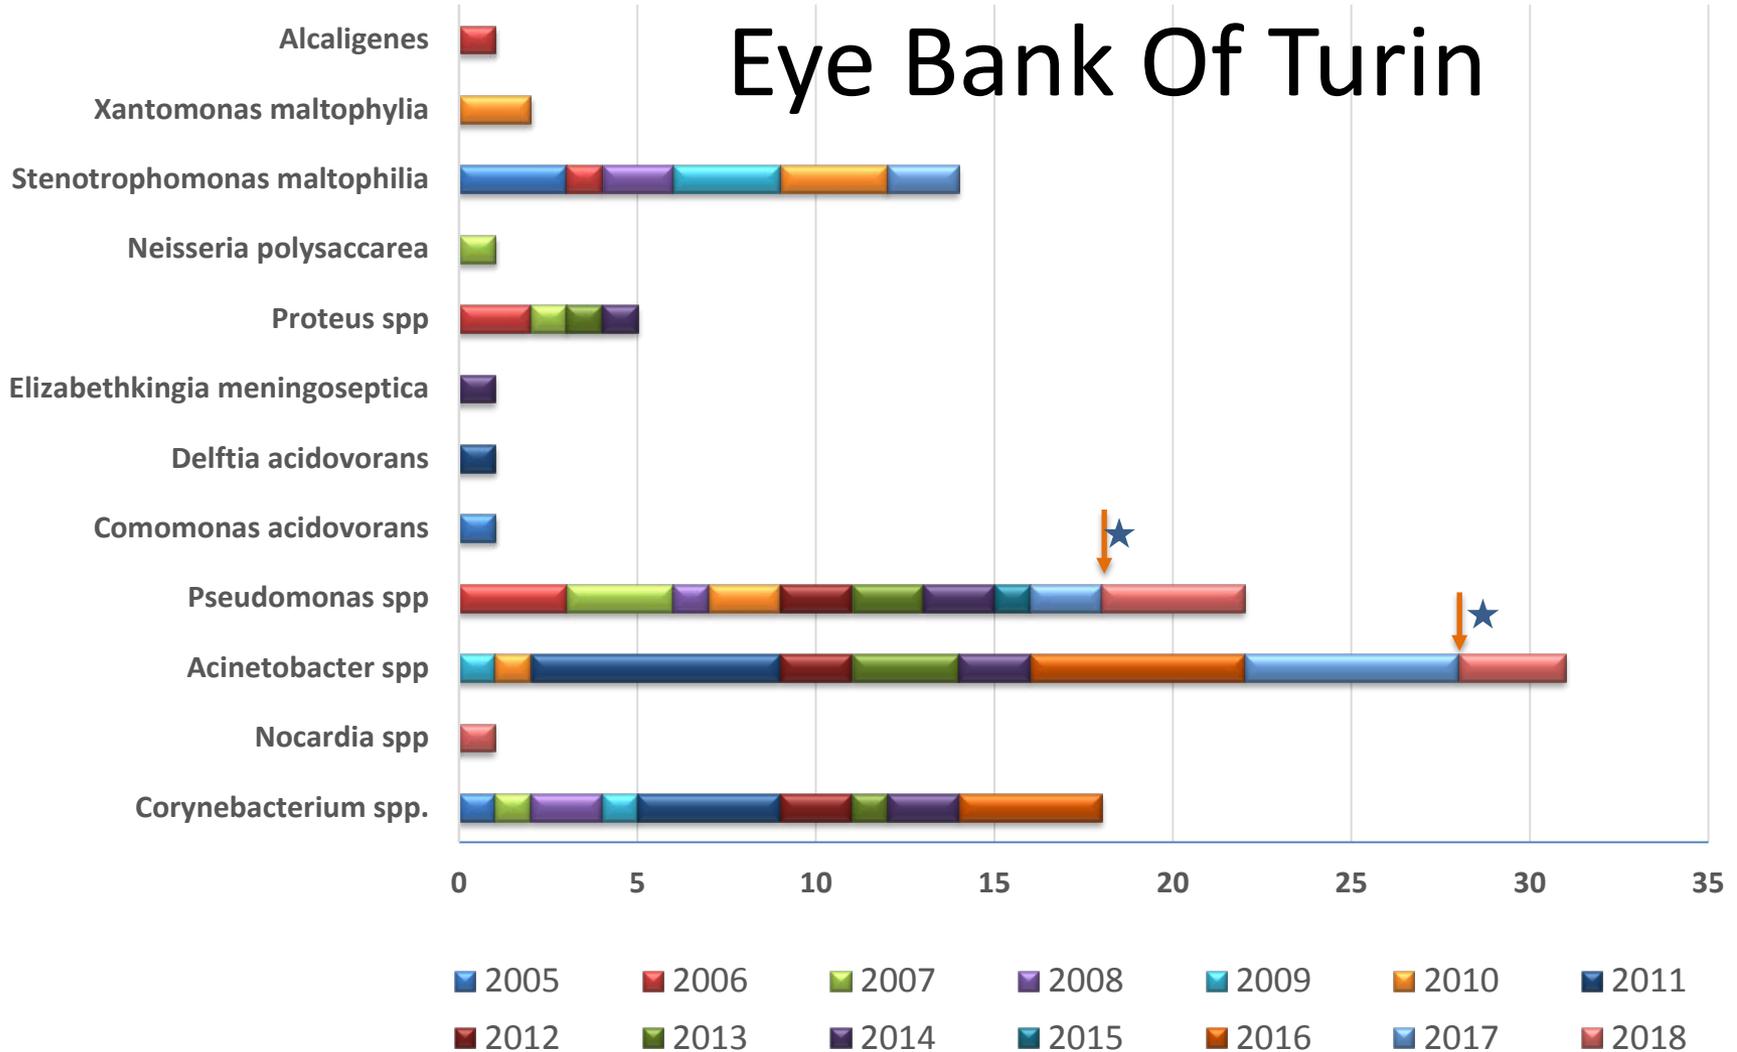

ANAEROBI

Contaminating Anaerobic Bacteria Eye Bank Of Turin

Contaminating Aerobic Bacteria Eye Bank Of Turin

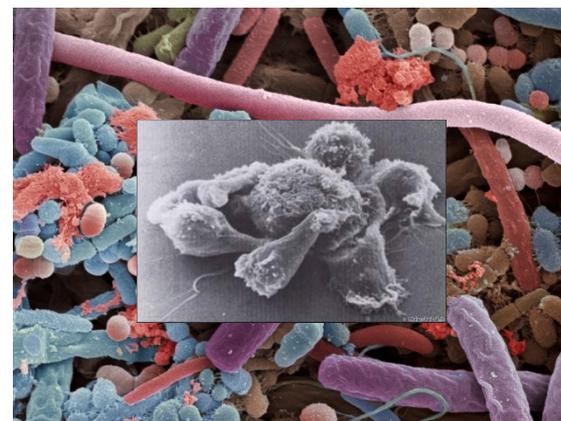

I pazienti ospedalizzati possono essere affetti da germi nosocomiali

Alterazioni del Sistema immunitario possono favorire la contaminazione microbica

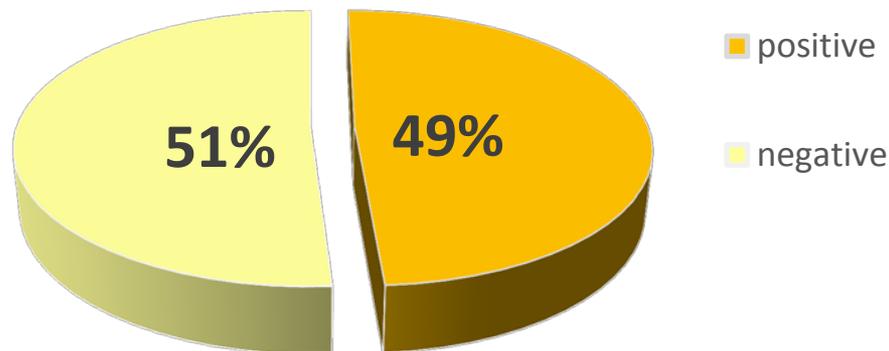

Quali sono i contaminanti?

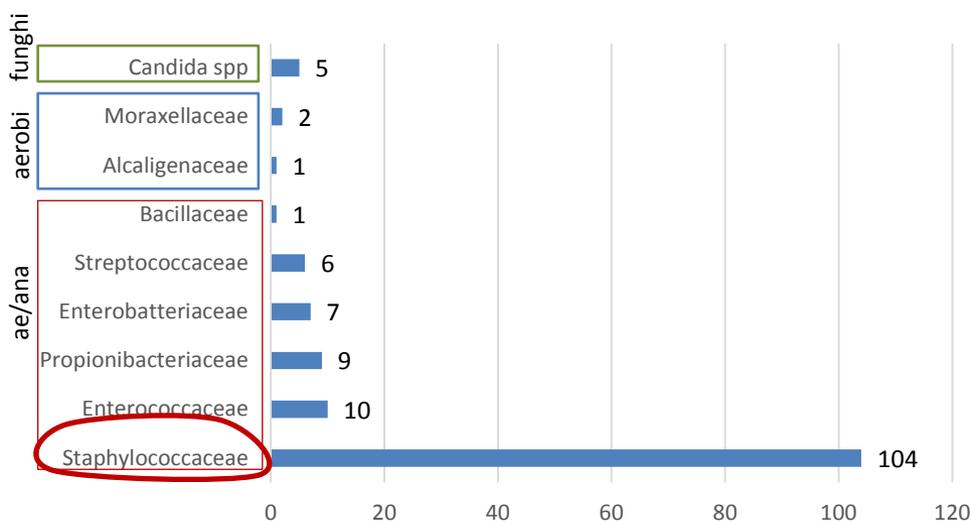

Biopsia da 265 tessuti
corneali in terreno
tioglicolato

Risultati delle biopsie

RESULTS	POSITIVE	NEGATIVE	TOTAL
NUMBER OF TISSUES	129 (49%)	136 (51%)	265
PREVIOUS INFECTION OF THE DONOR	27 (21%)	30 (22%)	57 (21,5%)

CONTAMINANT	PERCENTAGE
Candida spp.	3,4
Moraxellaceae	1,4
Alcaligenaceae	0,7
Bacillaceae	0,7
Streptococcaceae	4,1
Enterobacteriaceae	4,8
Propionibacteriaceae	6,2
Enterococcaceae	6,9
Staphylococcaceae	71,7

Conclusione 1

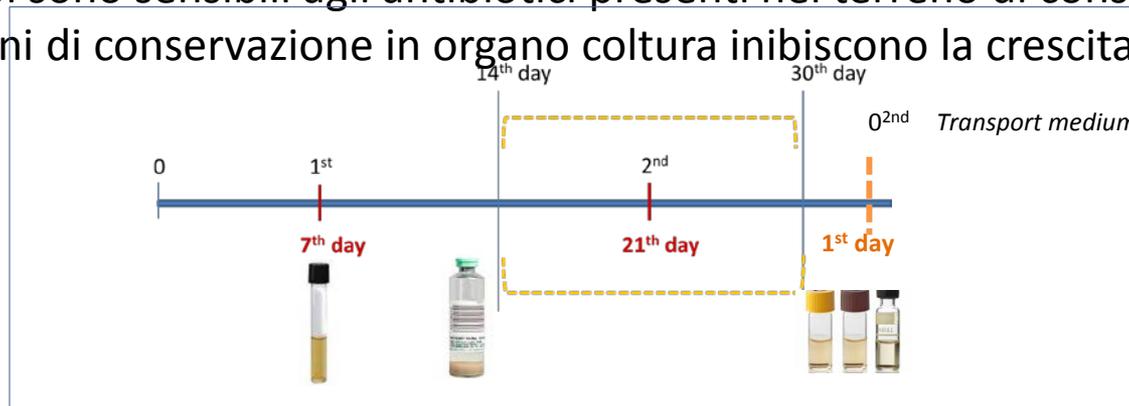

In tutti i campioni analizzati, la crescita microbica è stata rilevata solo in flaconi FA Plus e/o flaconi FN Plus.

Alcuni microrganismi a lenta crescita possono essere rilevati in un tempo successivo nel corso della conservazione, es. Candida o Enterococcus, due patogeni nosocomiali emergenti.

Non abbiamo rilevato microrganismi che crescono solo su BactAlert FN PLUS

- Gli anaerobi sono sensibili agli antibiotici presenti nel terreno di conservazione.
- Le condizioni di conservazione in organo coltura inibiscono la crescita di anaerobi.

Terreno di trasporto e di conservazione

Technical Guidelines for Ocular Tissue

4. Scleral Tissue

4.4 Decontamination And Microbiological Control:

Decontamination in an antibiotic bath for 20 minutes before storage in glycerine, or a quarantine period in ethanol 70% for 14 days before renewal of the ethanol 70%, is recommended in addition to the **performance of microbiological tests of storage solution and/or piece of tissue before final storage and release for surgery.**

The efficacy of the microbiological testing method should be evaluated and validated.

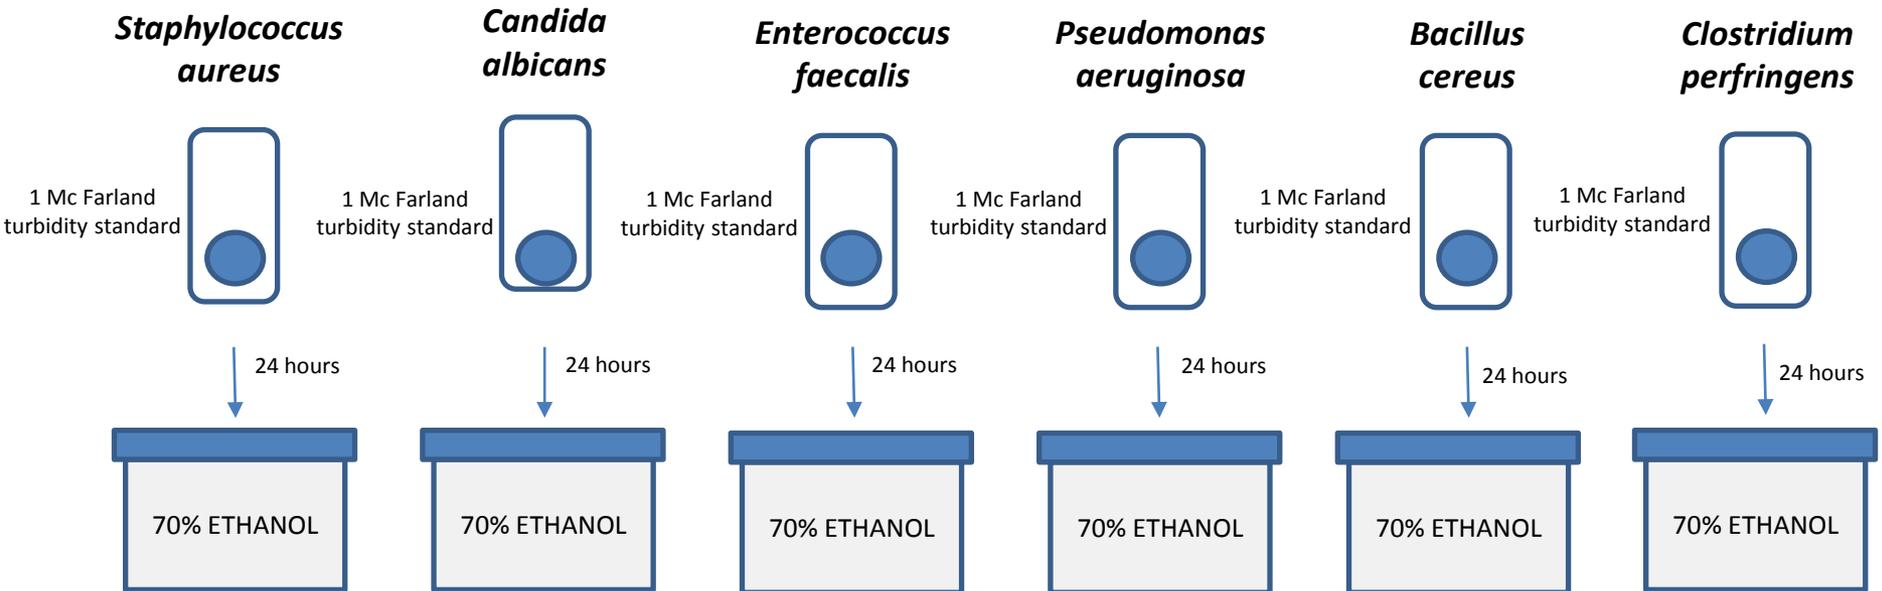

Obiettivo:

Determine the ability of bacteria to survive in sclera preserved in 70% ethanol

Materiali e Metodi

12 fresh human sclerae were submitted to several cuts and 96 scleral patches were obtained. They were divided in 6 groups, and placed in saline solutions containing:

BIOPSY

THIOGLYCOLLATE

3 mL

BACT/ALERT

0,5 mL /each

None of the bacterial species was isolated from storage solution, neither from biopsy at all periods tested

B. Cereus was recovered from contaminated scleral patches at all immersion period tested, from 2 hours of immersion until the 43nd day.

C. Perfringens was recovered from contaminated scleral patches at 2H, 24H, 48H, until 10D of immersion.

Discussione

Le infezioni della sclera sono difficili da eradicare, per la nota scarsa penetrazione dell'antibiotico all'interno del tessuto. Di conseguenza, è di fondamentale importanza l'impiego di tessuti microbiologicamente controllati.

L'etanolo 70% solution rappresenta una soluzione eccellente per la conservazione di tessuto sclerale umano per l'attività germicida, e la facilità d'uso

Tuttavia alcuni microrganismi possono sopravvivere nei tessuti sclerali conservati nella soluzione di etanolo 70%.

Conclusione 2

Il nostro studio suggerisce che effettuare una biopsia di routine sul tessuto sclerale conservato in soluzione alcoolica può rappresentare uno strumento importante nell'analisi di una eventuale contaminazione microbica.

Al momento, l'inoculo diretto di un frammento di tessuto sclerale in terreno tioglicolato sembra essere una soluzione vantaggiosa nel rilevare una eventuale contaminazione da batteri sporigeni e un'opportunità di innestare un tessuto più sicuro dal punto di vista microbiologico.
